

# Package: shikakusphere (via r-universe)

October 22, 2024

**Title** Miscellaneous Functions for Japanese Mahjong

**Version** 0.0.3.9003

**Description** A collection of miscellaneous functions for Japanese Mahjong that wraps C++ sources of 'cmajiang'  
<<https://github.com/TadaoYamaoka/cmajiang>>.

**License** MIT + file LICENSE

**BugReports** <https://github.com/paithiov909/shikakusphere/issues>

**Depends** R (>= 2.10)

**Imports** generics, magick, methods, purrr, Rcpp, rlang, stringi, vctrs

**Suggests** rsvg, testthat (>= 3.0.0)

**LinkingTo** Rcpp

**Config/testthat/edition** 3

**Encoding** UTF-8

**LazyData** true

**Roxygen** list(markdown = TRUE)

**RoxygenNote** 7.3.2

**Repository** <https://paithiov909.r-universe.dev>

**RemoteUrl** <https://github.com/paithiov909/shikakusphere>

**RemoteRef** HEAD

calc_defen	<i>Calculate score of hand</i>
------------	--------------------------------

---

### Description

Calculate score of hand

### Usage

```
calc_defen(
  pai,
  baopai,
  libaopai = "",
  rongpai = "",
  rule = default_rule(),
  zhuangfeng = c("z1", "z2", "z3", "z4"),
  menfeng = c("z2", "z3", "z4", "z1"),
  lizhi = c("none", "lizhi", "double-lizhi"),
  yifa = FALSE,
  qianggang = FALSE,
  lingshang = FALSE,
  haidi = c("none", "haidimoyue", "hedilaoyu"),
  tianhe = c("none", "tianhe", "dihe"),
  changbang = 0L,
  lizhibang = 0L
)
```

### Arguments

pai	A string scalar. This param is not vectorized.
baopai	A character vector. "Dora" indicators.
libaopai	A character vector. "Ura-dora" indicators. Leave empty if there is no libaopai.
rongpai	A string scalar such as "m1=". Leave empty if there is no rongpai.
rule	A list; a rule set. Defaults to default_rule().
zhuangfeng	A string scalar; "ba-kaze" tile.
menfeng	A string scalar; "ji-kaze" tile.
lizhi	A string scalar. Either "none", "lizhi", or "double-lizhi".

yifa	A logical scalar; flag for "ippatsu".
qianggan	A logical scalar; flag for "chankan".
lingshang	A logical scalar; flag for "rinshan-kaihou".
haidi	A string scalar. Either "none", "haidimoyue", or "hedilaoyu".
tianhe	A string scalar; Either "none", "tianhe", or "dihe".
changbang	An integer scalar; the number of counter sticks that indicates "honba".
lizhibang	An integer scalar; the number of 1,000-point sticks on the table.

**Value**

A data frame.

**Examples**

```
calc_defen("m345567p234s3378", baopai = "z1", rongpai = "s9=")
```

---

calc_xiangting	<i>Calculate xiangting number of hands</i>
----------------	--

---

**Description**

Calculate xiangting number of hands

**Usage**

```
calc_xiangting(pai)
```

**Arguments**

pai            A character vector.

**Value**

An integer vector.

**Examples**

```
calc_xiangting(c("m345567p234s3378", "p222345z1234567"))
```

---

collect_tingpai	<i>Collect tingpais for hands</i>
-----------------	-----------------------------------

---

**Description**

Collect tiles that can decrease the xiangting number of hands if they are drawn. In case of already winning hands, corresponding vectors will be NA.

**Usage**

```
collect_tingpai(pai)
```

**Arguments**

pai                    A character vector.

**Value**

A list of character vectors.

**Examples**

```
collect_tingpai(c("m345567p234s3378", "p222345z1234567"))
```

---

default_rule	<i>Create default rule set</i>
--------------	--------------------------------

---

**Description**

Create default rule set

**Usage**

```
default_rule()
```

**Value**

A list.

**See Also**

<https://github.com/kobalab/majiang-core/wiki/%E3%83%AB%E3%83%BC%E3%83%AB>

---

hand2img	<i>Plot a player's hand as an image</i>
----------	---

---

**Description**

This function is a short hand for `paistr(pai) |> plot()`

**Usage**

```
hand2img(pai, ...)
```

**Arguments**

<code>pai</code>	A character vector.
<code>...</code>	Other arguments passed to <code>plot()</code> .

**See Also**

[paistr](#)

---

hupai	<i>List of hupai</i>
-------	----------------------

---

**Description**

List of hupai

**Usage**

```
hupai
```

**Format**

An object of class `data.frame` with 54 rows and 3 columns.

**Details**

A data frame that contains the list of hupai.

The list includes the following columns:

- `id`: The id of the hupai.
- `en`: The English name of the hupai.
- `jp`: The Japanese name of the hupai.

---

int2tile	<i>Convert integers to tiles</i>
----------	----------------------------------

---

**Description**

Convert integers to tiles

**Usage**

```
int2tile(x = seq_len(38) - 1, origin = c("zero", "one"))
```

**Arguments**

x	An integer vector.
origin	A string scalar. Either "zero" or "one".

**Value**

A factor.

**Examples**

```
int2tile(c(0, 1, 25, 37))
```

---

lineup	<i>Line up tiles</i>
--------	----------------------

---

**Description**

Arrange all tiles from a data frame.

**Usage**

```
lineup(x)
```

**Arguments**

x	A data frame with columns id, tile, and n.
---	--

**Value**

An object of x\$tile class.

**Examples**

```
rand_hands()(3) |>
  paistr() |>
  tidy() |>
  lineup()
```

---

lipai	<i>Compose hands from character vectors</i>
-------	---

---

**Description**

Compose hands from character vectors while ignoring invalid tiles. This function can handle any number of tiles in each hand, but cannot more than 5 identical tiles. If there are more than 5 identical tiles, arises an error.

**Usage**

```
lipai(x)
```

**Arguments**

x                    A list of character vectors or a character vector.

**Value**

A character vector.

**Examples**

```
lipai(list(c("m1", "m2", "m3"), c("p1", "p2", "p3")))
```

---

modify_rule	<i>Modify the default rule set by patch</i>
-------------	---

---

**Description**

Modify the default rule set by patch

**Usage**

```
modify_rule(patch = list())
```

**Arguments**

patch                A list.

**Value**

A list.

---

paistr	paistr <i>vector</i>
--------	----------------------

---

### Description

Create a `paistr` vector from a character vector that represents player's hands.

### Usage

```
paistr(x = character())

is_paistr(x)

## S3 method for class 'skksph_paistr'
plot(x, y, ...)

## S3 method for class 'skksph_paistr'
tidy(x, ...)
```

### Arguments

<code>x</code>	<ul style="list-style-type: none"> <li>For <code>paistr()</code>: A character vector.</li> <li>For <code>is_paistr()</code>: An object to test.</li> <li>For <code>plot()</code>: An object to plot as an image.</li> <li>For <code>tidy()</code>: An object to tidy up.</li> </ul>
<code>y</code>	<ul style="list-style-type: none"> <li>For <code>plot()</code>: Not used.</li> </ul>
<code>...</code>	Other arguments for <code>plot()</code> or <code>tidy()</code> .

### Details

Note that the validation of this function is not so strict. For example, `paistr("z0")` still produces a valid `paistr` vector even though "z0" is not a tile that actually exists. These `paistr` are simply ignored by the 'cmajiang' function wrapper.

The number of tiles displayed when `print()` is not always accurate, so if you need to count the actual number of tiles, use `tidy()`.

### Value

- For `paistr()`: An object of class `skksph_paistr`.
- For `is_paistr()`: A logical scalar.
- For `plot()`: A bitmap image that internally converted by `magick::image_read_svg()` is invisibly returned.
- For `tidy()`: A data frame (not a tibble).

**Examples**

```

pai <- paistr(c("m055z7z7,m78-9,z5555,z666=", "m123s789z1117*,p5550"))
print(pai)
is_paistr(pai)
tidy(pai)

```

---

parse_hupai	<i>Parse chains of hupai ids</i>
-------------	----------------------------------

---

**Description**

Parse comma separated chains of hupai ids into a list of factors.

**Usage**

```
parse_hupai(str, lang = c("en", "jp"))
```

**Arguments**

str	A character vector.
lang	A string scalar. Either "en" or "jp".

**Value**

A list of factors.

---

rand_hands	<i>Create a function to randomly generate hands</i>
------------	---

---

**Description**

Create a function to randomly generate hands

**Usage**

```

rand_hands(
  hupai = c("pinghe", "zhuangfeng", "menfeng", "fanpai", "duanyaojiu", "yibeikou",
    "sansetongshun", "yiqitongguan", "hunquandaiyaojiu", "qiduizi", "duiduihu",
    "sananke", "sangangzi", "sansetongke", "hunlaotou", "xiaosanyuan", "hunyise",
    "chunquandaiyaojiu", "erbeikou", "qingyise", "guoshiwushuang", "sianke", "dasanyuan",
    "xiaosixi", "dasixi", "ziyise", "lvyise", "qinglaotou", "sigangzi", "jiulianbaodeng"),
  zhuangfeng = c("z1", "z2", "z3", "z4"),
  menfeng = c("z2", "z3", "z4", "z1"),
  rule = default_rule(),
  seed = 1234
)

```

**Arguments**

hupai	A string scalar.
zhuangfeng	A string scalar; "ba-kaze" tile.
menfeng	A string scalar; "ji-kaze" tile.
rule	A list; a rule set. Defaults to <code>default_rule()</code> .
seed	An integer scalar. Used for initializing the random number generator.

**Value**

A function inheriting class `purrr_function_partial` that takes single arguments `n`: number of hands to be generated.
